On a regular basis I talk with friends and colleagues about DevOps and since I posted an article on why it would make more sense to drop the capitals and go for devops instead, I am asked about my view on BizDevOps and DevSecOps. Just like DevOps, they are usually associated with technology and software-based products in particular. And just like DevOps, BizDevOps and DevSecOps must be viewed from a business context. They are different organizational structures to improve the effectiveness of the organization's processes to deliver value to its stakeholders. Just to keep it abstract and conceptually.

Business and Security

In this article I will explain my thoughts about both concepts, the first being the crazy thought to involve your business in the product development cycle and the latter the outrageous idea to consider security as part of your concerns. I am of course being sarcastic, which should tell you somewhat of where I will be going.

While DevOps makes Sense

In my article “devops sans the Capitals” I explain why I prefer to spell devops in all lower case. I think it emphasizes the lack of silos in an organization where product development and its operations are the responsibility of a single team. With that being said, I do understand the reasoning behind using a capital D and O in DevOps, To me it feels that when you spell it like DevOps you imply that there is a Dev and an Ops silo working together, each with their own responsibilities, in your organization. Development and Operations are two different sides of the same coin, each with their concerns.
